# Retail Sales & Profit Dashboard

## 1. Introduction

This report explains the Power BI dashboard I built to study the sales performance of a retail company. The goal was to look at how sales and profit change across different products, categories, regions, and outlet types, so that management can quickly understand where the business is doing well and where it needs attention.

## 2. About the Data

The data used for this project is the store sales dataset. It has close to one lakh rows and covers several columns. Each row shows one order, along with details such as the product, category, region, sales amount, profit, quantity, and discount.

### 2.1 Main Columns Used

- Category of Goods and Sub-Category – type of product sold
- Product Name – name of the item sold
- Region and State – where the order was placed
- Outlet Type and City Type – size and location of the store
- Segment – Consumer or Corporate customer
- Sales – total money earned from the order
- Profit – money earned after cost
- Quantity – number of items sold
- Year – when the order was placed

## 3. Steps I Followed

I built this dashboard in Power BI Desktop by following these steps:

### 3.1 Loading the Data

I opened Power BI Desktop and used Get Data to import the store sales CSV file into Power BI. All the columns loaded correctly and appeared in the Fields list.

### 3.2 Building the KPI Cards

I added two Card visuals at the top of the dashboard to show the Total Sales and Total Profit. These give management a quick summary before looking at the detailed charts.

### 3.3 Building the Visuals

- Column Chart – Sales by Category of Goods
- Table – Product Name, Sales, and Profit
- Line Chart – Sales Trend by Year
- Column Chart – Sales by Region
- Pie Chart – Sales by Segment
- Donut Chart – Sales by Outlet Type

### 3.4 Adding a Filter (Slicer)

I added a Slicer for Year. This lets anyone using the dashboard click and filter the data by year themselves, without needing to edit the report.

### 3.5 Formatting the Dashboard

I added a title text box at the top of the page, made it bold and larger, and arranged the cards and charts so the dashboard looks neat and easy to read for management.

## 4. Key Numbers (KPI Summary)

These are the two main numbers I put as cards at the top of my dashboard, so anyone can see the overall performance in one glance:

| Total Sales | Total Profit |
|-------------|--------------|
| 497.52 M    | 74.45 M      |

## 5. What the Dashboard Shows

### 5.1 Sales by Category

Categories such as Seasonal Fruits & Vegetables, Electric Appliances, Furniture, Fast Food, Household Items, and Dairy Products all sell at broadly similar levels, showing that the business does not depend on just one category.

### 5.2 Sales by Region

Sales are fairly evenly spread across South, East, West, and North, which means the company has a balanced presence across regions rather than depending on one area.

### 5.3 Sales by Segment

Consumer and Corporate customers contribute almost equally to sales, with Consumer at about 49.9% and Corporate at about 50.1%.

### 5.4 Sales by Outlet Type

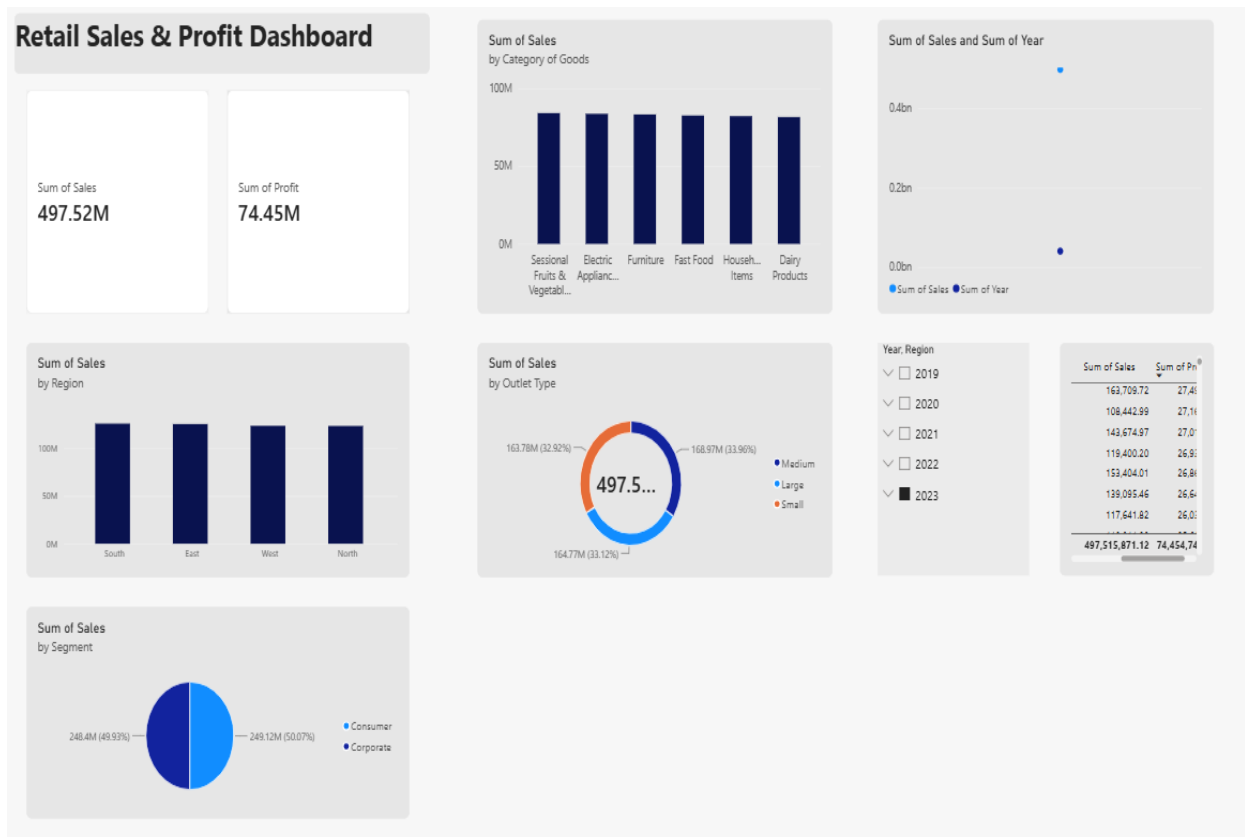

Sales are split almost evenly across Large, Medium, and Small outlets, each contributing close to one third of total sales.

### 5.5 Top-Selling Products

The product table lists each product along with its total sales and profit, which helps identify which items are performing the best and which ones need attention.

## 6. Dashboard Screenshot

Below is the final dashboard page, showing all the cards, charts, the table, and the slicer together.

## 7. Conclusion

The dashboard shows that the company has a balanced business, with sales spread evenly across categories, regions, customer segments, and outlet types. Management can use this dashboard to keep track of overall sales and profit at a glance, and to drill down into any category, region, or product using the Year filter whenever a closer look is needed.
