Superstore Sales Performance Dashboard

1. Introduction

This report explains the Power BI dashboard I built to study sales performance for a retail company called Superstore. The goal was to look at how sales and profit change across different products, categories, and regions, so that management can quickly understand where the business is doing well and where it needs attention.

2. About the Data

The data used for this project is the Superstore sales dataset. It has 9,994 rows and 19 columns. Each row shows one order, along with details such as the product, category, region, sales amount, profit, quantity, and discount.

2.1 Main Columns Used

- Category and Sub-Category – type of product sold
- Region and State – where the order was placed
- Sales – total money earned from the order
- Profit – money earned after cost
- Quantity – number of items sold
- Order Date – when the order was placed

3. Steps I Followed

I built this dashboard in Power BI Desktop by following these steps:

3.1 Loading the Data

I opened Power BI Desktop and used Get Data to import the Superstore CSV file into Power BI.

3.2 Cleaning the Data

I opened Power Query Editor (Transform Data) and checked that every column had the correct data type. I set Order Date and Ship Date as Date, Sales, Profit and Discount as Decimal Number, and Quantity as Whole Number. This step is important because wrong data types can cause charts to show wrong results.

3.3 Building the Visuals

After the data was clean, I built the following visuals on the report page:

- Bar Chart – Sales by Category
- Treemap – Sales by Sub-Category
- Column Chart – Sales by Region
- Line Chart – Sales Trend by Year

- Table – Top 10 Products by Sales

3.4 Adding KPI Cards

I added three Card visuals at the top of the dashboard to show the total Sales, total Profit, and total Quantity sold. These give management a quick summary before looking at the detailed charts.

3.5 Adding Filters (Slicers)

I added two Slicers, one for Region and one for Category. This lets anyone using the dashboard click and filter the data themselves, without needing to edit the report.

3.6 Formatting the Dashboard

I added a title text box at the top of the page, made it bold and larger, and applied a clean, professional colour theme so the dashboard looks neat and easy to read for management.

4. Key Numbers (KPI Summary)

Total Sales	Total Profit	Total Quantity Sold
₹22,97,200.86 (2.30 M)	₹2,86,397.02 (286.4 K)	37,873 units

5. What the Dashboard Shows

5.1 Sales by Category

Technology has the highest sales (about 8.36 lakh), followed closely by Furniture (about 7.42 lakh) and Office Supplies (about 7.19 lakh). All three categories sell at almost similar levels, but Technology is slightly ahead.

5.2 Profit by Category — An Important Finding

This is the most important pattern in the data. Even though Furniture has good sales, it earns very little profit (only about ₹18,451). Technology earns the most profit (about ₹1.45 lakh), and Office Supplies earns about ₹1.22 lakh. This means Furniture sales look good on paper, but they are not bringing in much profit for the company.

5.3 Sales by Region

The West region has the highest sales, followed by East, then Central, and South has the lowest sales among all regions.

5.4 Sales Trend Over Time

Sales have grown steadily from 2014 to 2017, with the biggest jump happening after 2015. This shows the business is growing year after year.

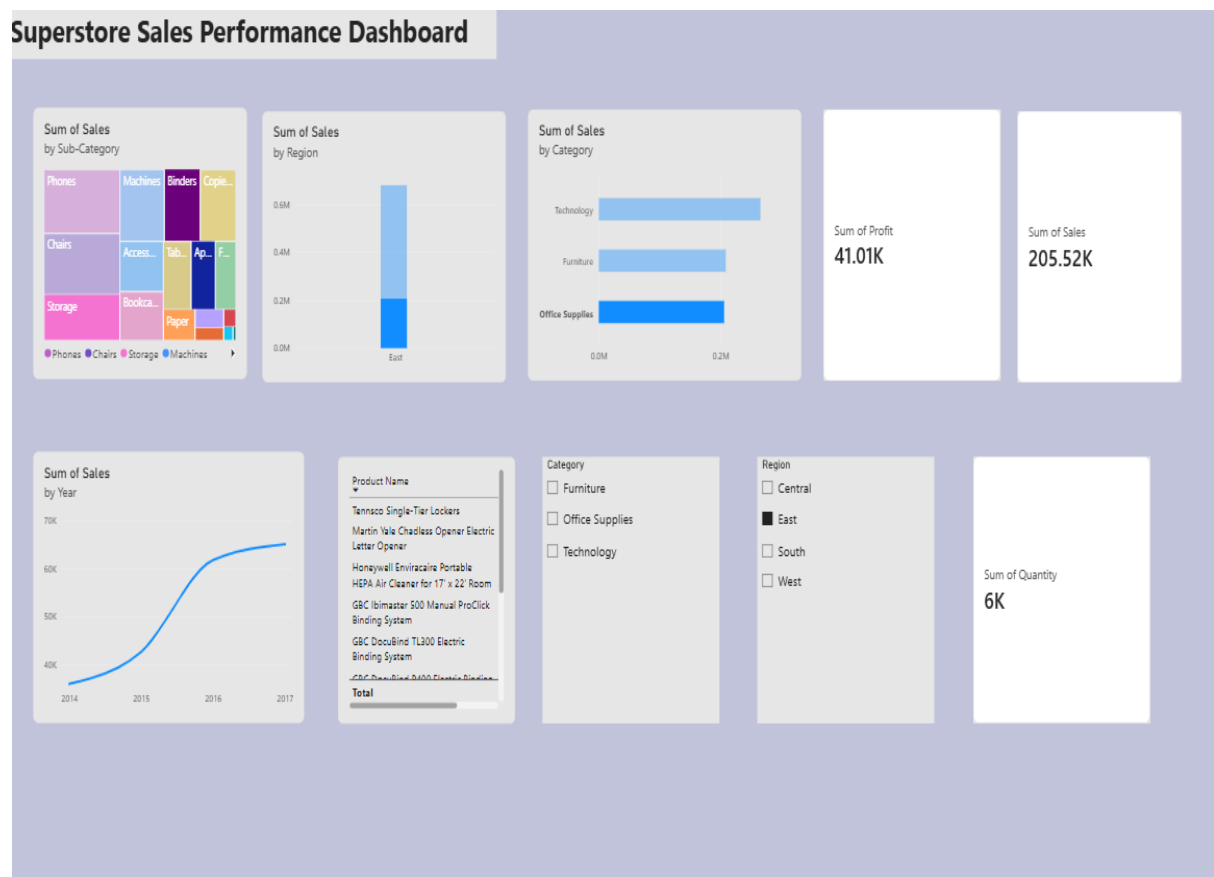

5.5 Top-Selling Sub-Categories

Rank	Sub-Category	Total Sales
1	Phones	₹3,30,007
2	Chairs	₹3,28,449
3	Storage	₹2,23,844
4	Tables	₹2,06,966
5	Binders	₹2,03,413

5.6 Sub-Categories Losing Money

Tables is the biggest problem area — it loses about ₹17,725 overall, even though it has good sales. Bookcases and Supplies also lose a small amount of money. This means these products are often sold at a discount that is too high, which eats into the profit.

6. Dashboards Overview

6. Conclusion

The dashboard shows that the company is growing well in total sales, especially in the West region and in the Technology category. However, Furniture and Tables need attention because they are not making good profit, even though they sell well. Management can use this dashboard to decide where to focus — for example, reducing discounts on Tables and Furniture, and investing more in Technology and the West region, which are performing the best.
